PROJECT TITLE

RECEPTIONIST CHATBOT VIA DEEP LEARNING TECHNIQUES

A receptionist chatbot is an AI-based system designed to interact with users, typically visitors or customers, to provide assistance or information similar to what a human receptionist would offer.

PROBLEM STATEMENT

- Chatbots may be limited by predefined rules or patterns.
- AI chatbots, while efficient, pose ethical challenges such as privacy, consent, transparency, and accountability.
- It's crucial to only collect necessary data and protect it from misuse, with customer consent.
- AI chatbots to not only automate customer support, but they also help optimise conversion rates, improve customer experiences, and contribute to direct revenue.
- In fact, AI chatbots have helped generate a 60% increase in revenue for e-commerce businesses.

Project overview

Receptionist chatbots have numerous applications across various industries and settings, contributing to improved efficiency, customer satisfaction, and operational effectiveness.

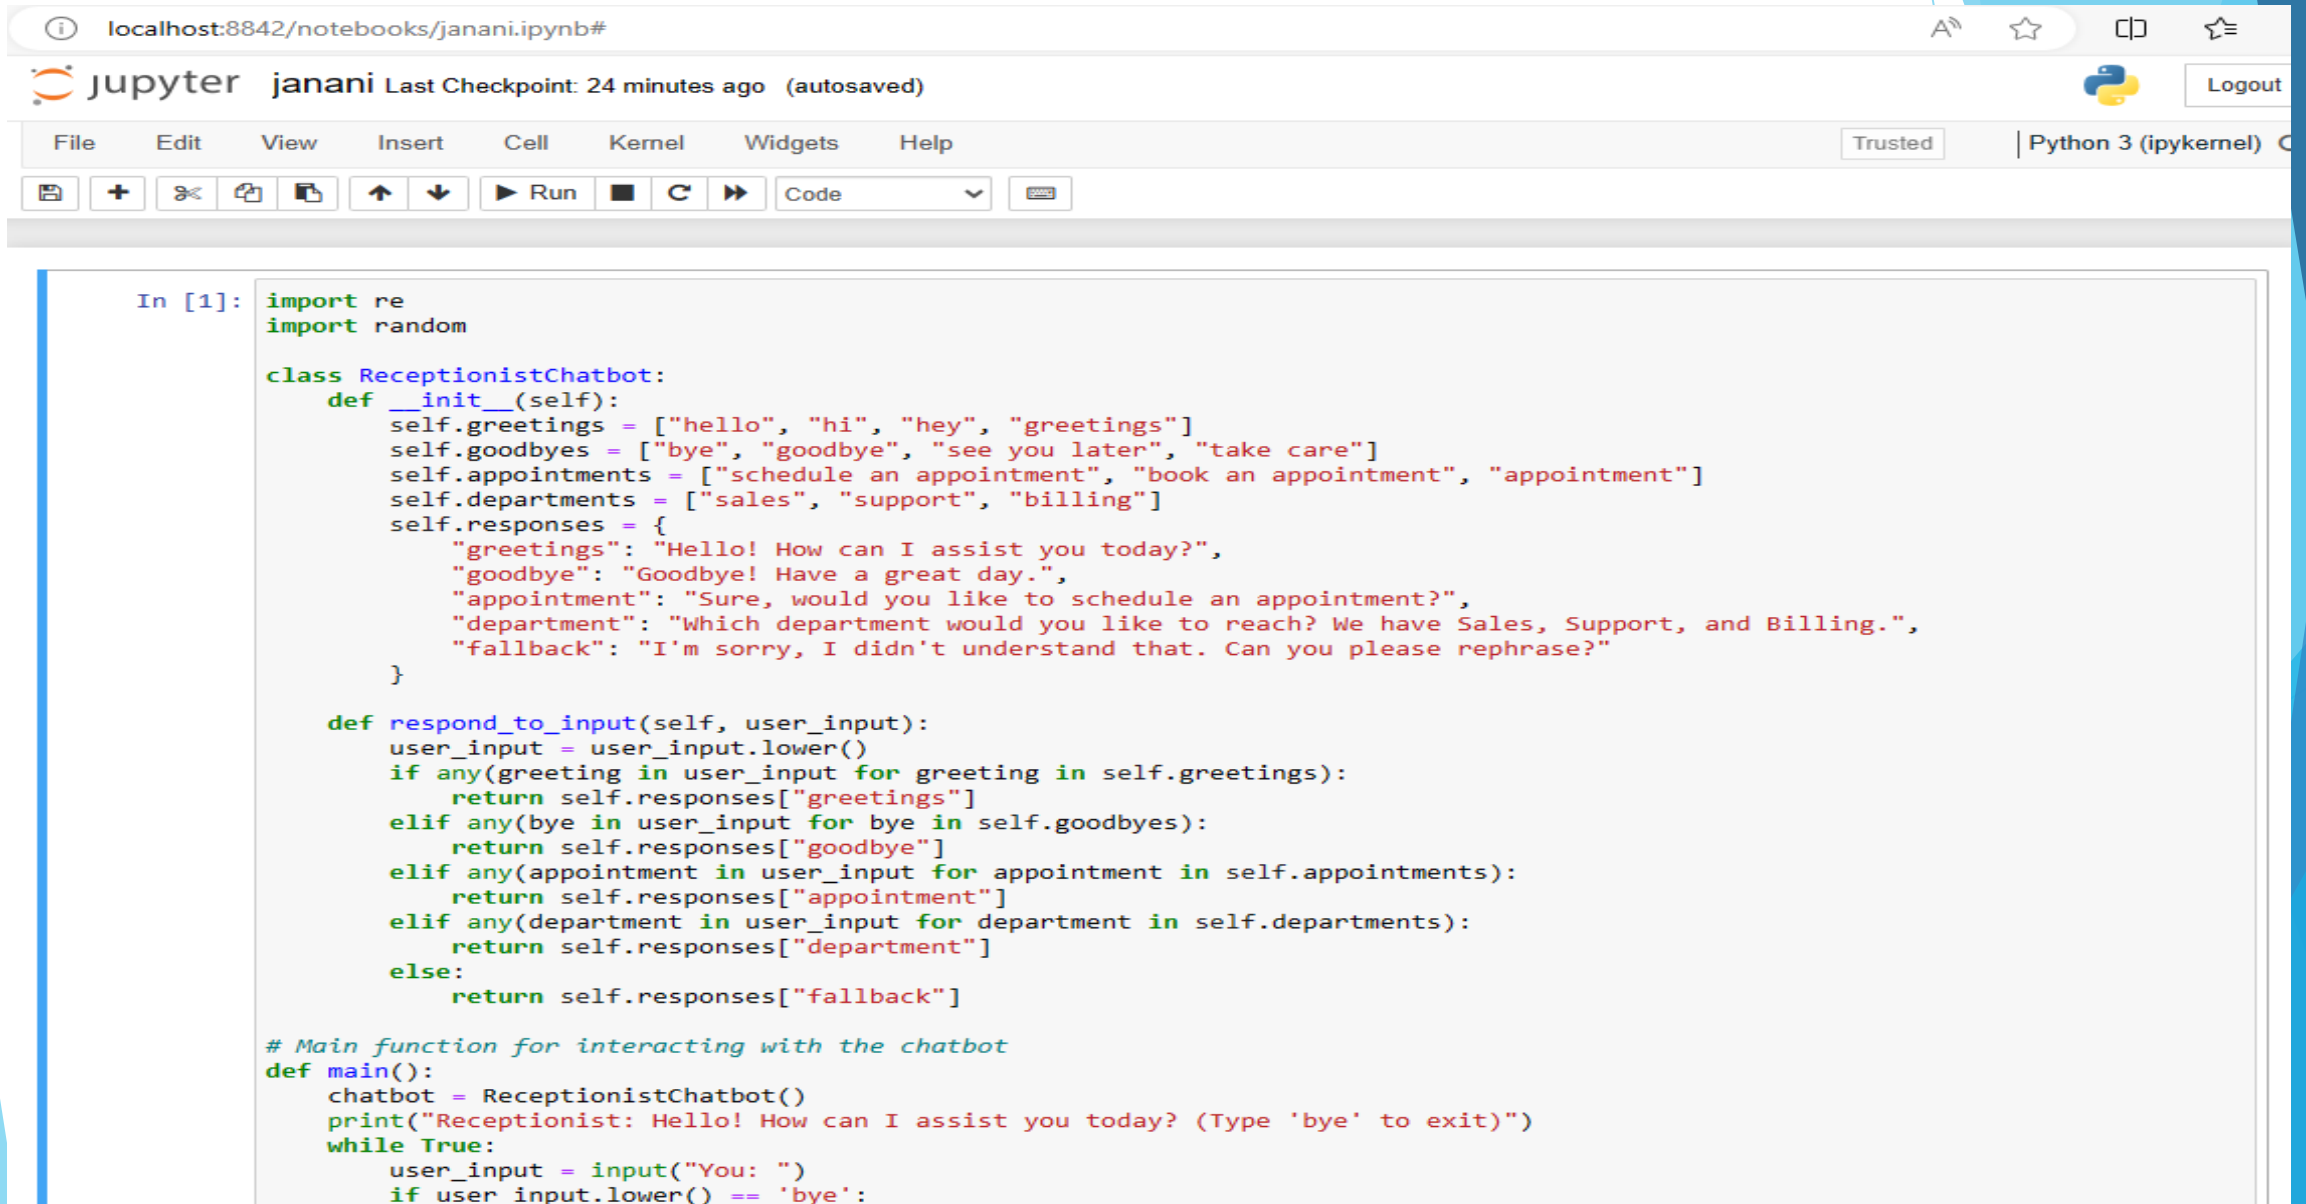

Creating a receptionist chatbot involves leveraging various ,

1. Natural Language Processing (NLP) Libraries
2. Machine Learning Frameworks
3. Chatbot Development Platforms
4. Messaging Platforms and APIs

By leveraging these tools and libraries, developers can build powerful and efficient receptionist chatbots that provide seamless and personalized interactions with users.

MY WORK....

Here I have done my work in the above mentioned topic let's make a sight on it

The screenshot displays a Jupyter Notebook interface in a web browser. The address bar shows 'localhost:8842/notebooks/janani.ipynb#'. The Jupyter logo and 'janani' are visible, along with a 'Last Checkpoint: 24 minutes ago (autosaved)' status. A menu bar includes File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. A toolbar contains icons for file operations and execution. The notebook is running Python 3 (ipykernel). The code in the first cell defines a 'ReceptionistChatbot' class with attributes for greetings, goodbyes, appointments, and departments, and methods for handling user input and a main function for interaction.

```
In [1]: import re
import random

class ReceptionistChatbot:
    def __init__(self):
        self.greetings = ["hello", "hi", "hey", "greetings"]
        self.goodbyes = ["bye", "goodbye", "see you later", "take care"]
        self.appointments = ["schedule an appointment", "book an appointment", "appointment"]
        self.departments = ["sales", "support", "billing"]
        self.responses = {
            "greetings": "Hello! How can I assist you today?",
            "goodbye": "Goodbye! Have a great day.",
            "appointment": "Sure, would you like to schedule an appointment?",
            "department": "Which department would you like to reach? We have Sales, Support, and Billing.",
            "fallback": "I'm sorry, I didn't understand that. Can you please rephrase?"
        }

    def respond_to_input(self, user_input):
        user_input = user_input.lower()
        if any(greeting in user_input for greeting in self.greetings):
            return self.responses["greetings"]
        elif any(bye in user_input for bye in self.goodbyes):
            return self.responses["goodbye"]
        elif any(appointment in user_input for appointment in self.appointments):
            return self.responses["appointment"]
        elif any(department in user_input for department in self.departments):
            return self.responses["department"]
        else:
            return self.responses["fallback"]

# Main function for interacting with the chatbot
def main():
    chatbot = ReceptionistChatbot()
    print("Receptionist: Hello! How can I assist you today? (Type 'bye' to exit)")
    while True:
        user_input = input("You: ")
        if user_input.lower() == 'bye':
```

```
        return self.responses["greetings"]
    elif any(bye in user_input for bye in self.goodbyes):
        return self.responses["goodbye"]
    elif any(appointment in user_input for appointment in self.appointments):
        return self.responses["appointment"]
    elif any(department in user_input for department in self.departments):
        return self.responses["department"]
    else:
        return self.responses["fallback"]

# Main function for interacting with the chatbot
def main():
    chatbot = ReceptionistChatbot()
    print("Receptionist: Hello! How can I assist you today? (Type 'bye' to exit)")
    while True:
        user_input = input("You: ")
        if user_input.lower() == 'bye':
            print("Receptionist: Goodbye! Have a great day.")
            break
        response = chatbot.respond_to_input(user_input)
        print("Receptionist:", response)

if __name__ == "__main__":
    main()
```

Solution and its value proposition

```
Receptionist: Hello! How can I assist you today? (Type 'bye' to exit)
You: hello
Receptionist: Hello! How can I assist you today?
You: bye
Receptionist: Goodbye! Have a great day.
```

- A simple chatbot answering all the questions of a patient, customer, anyone for their needs.
- They can identify the emotions and feelings expressed in terms of their words provided by the users.
- They are human like repliers which answers all our needs according to our questions.
- Nearly 70% of our queries can be answered...
- They highly contribute towards various fields such as manufacturing, trade, medicine, etc....

The wows in my solution...

By leveraging cutting-edge artificial intelligence and natural language processing technologies, our chatbot aims to transform traditional receptionist roles and deliver an unparalleled experience to our visitors and customers.

Our chatbot will be available round the clock, ensuring that visitors can access assistance and information at any time, regardless of office hours.

- **Appointment Scheduling**
- **Enhanced User Experience**
- **Cost Savings**
- **Resource Optimization**
- **Continuous Improvement**

Application areas

Receptionist chatbots have numerous applications across various industries and settings.

Here are some key application areas of receptionist chatbots:

1. Corporate Offices and Business Centers
2. Hotels and Hospitality
3. Healthcare Facilities
4. Educational Institutions.
5. Retail and Shopping
6. Government Offices and Public Services

THANK YOU!!
